Abstract

This project aims to improve the information architecture of the grocery section in the HungerStation application by focusing on organization, usability, and clarity. Conducted by students from Umm Al-Qura University, the study followed a structured three-phase approach. In the initial phase, we distributed a questionnaire targeting university students to gather real feedback on pain points in the app, particularly related to product categorization and navigation. User personas were created based on the data to guide the design decisions. In the second phase, we conducted open and closed card sorting activities to understand how users naturally group grocery items. These insights informed the development of a new sitemap and low-fidelity wireframes that better matched user expectations. Finally, in the third phase, usability testing was carried out using the wireframes. All participants successfully completed the tasks, indicating improved usability. The results highlight the importance of aligning digital content with user mental models to enhance the overall shopping experience.

Introduction

Grocery delivery applications play an essential role in modern consumer behavior, especially in busy lifestyles where convenience is key. HungerStation, a popular delivery app in Saudi Arabia, offers a grocery feature that allows users to order food and essential items. However, many users experience challenges in navigating this section due to unclear product categorization and limited filtering options.

This project was developed as part of the Information Architecture course by students from Umm Al-Qura University. Our goal was to improve the usability and structure of the grocery section in the HungerStation app through a user-centered approach. We began by collecting user feedback via an online survey targeting university students. The results revealed recurring issues related to navigation, unclear categories, and inefficient search.

In response, we conducted card sorting exercises to reorganize product categories based on user perception. A sitemap was created to reflect this structure, and low-fidelity wireframes were developed to visualize the proposed layout. Finally, we conducted usability testing on the prototype, which confirmed that users were able to complete essential tasks without confusion. This project emphasizes the value of involving users in the design process to ensure that digital services meet their expectations and needs.

Phase One

Selected Too : surveys

<https://docs.google.com/forms/d/e/1FAIpQLSfPU-qMYeO6grbvQo2ba3EW-gulOaeDVyHdXtclorh6acX7aA/viewform?usp=preview>

Methodology: An online survey was created and distributed among a sample of users, all of whom were university students aged between 18 and 26 years.

The survey included sections on demographic information, frequency of using the HungerStation grocery section, satisfaction with features such as search clarity, product availability, promotional offers, ease of navigation, payment process, and overall user satisfaction.

It also provided an open-ended question to collect user suggestions for improving the grocery experience in the app.

Survey analysis:

The purpose of analyzing the survey results is to understand user experiences with the Hunger Station grocery section, identify strengths and weaknesses related to categorization, search functionality, navigation ease, and product availability. This analysis provides valuable insights to support the development of an improved information structure that aligns with user needs and expectations.

Question 1:

How many times do you use the Hunger Station grocery service per month?

Analysis:

The results show that the majority of participants (57.9%) use the Hunger Station grocery service only once a month indicating a low level of reliance on the service. Frequent users (those using it two or more times per month) represent smaller portion (42.1%), suggesting limited engagement with the platform as a primary grocery source. This usage pattern may be influenced by factors such as pricing, availability of alternatives, or the overall user experiences.

Question 2:
What are the main factors influencing your use of the app?

Analysis:

Top influencing factors include delivery speed, product availability, and discounts. Improving these aspects is crucial for user retention and satisfaction.

Question 3:
Is the search tool clear and useful for you when using the Hunger Station grocery service?

Analysis:

Most respondents (73.7%) indicated that the search tool is clear and useful, suggesting that it plays a positive role in enhancing the user experience. However, 22.4% selected "Maybe," which may reflect some uncertainty or inconsistency in how effective or intuitive the tool is across different situations. This points to an opportunity for improvement, especially in making the tool more consistently helpful for all users.

Question 4:
What types of products do you usually purchase?

Analysis:

Most frequently purchased items are fast food, snacks, and canned goods, indicating users prioritize convenience.

Question 5:
Does the Hunger Station grocery service always provide the products you are looking for?

Analysis:

A strong majority of participants (61.8%) responded "Yes," indicating that the service generally meets users' product expectations. However, 34.2% answered "Maybe," suggesting that while product availability is satisfactory for most, there are still instances where users may not find what they need. This highlights a potential area for improvement in inventory consistency or variety to better serve all customer needs.

Question 6:

Does the Hunger Station grocery service provide helpful suggestions during search (e.g., when searching for a specific type of chocolate, multiple available options appear)?

Analysis:

Most respondents (57.9%) answered “Yes,” indicating that the search function generally provides useful suggestions that assist users in finding what they need. However, a notable portion (32.9%) selected “Maybe,” and 9.2% said “No,” which suggests that the feature may not be consistently effective for everyone. This implies a need to enhance the search assistant feature to ensure more reliable and intuitive suggestions across different product categories.

Question 7:

Are the discounts and promotions effective?

Analysis

Many users feel the current promotions are insufficient or infrequent. Expanding discounts to include essential items is a potential improvement.

Question 8:

How do you find the experience of using the Hunger Station grocery service?

Analysis:

Most participants had a positive experience using the service, with 46.1% describing it as “Very Easy” and 30.3% as “Easy.” Additionally, 23.7% found it “Good,” which still reflects satisfaction, though with minor reservations. Notably, there were no mentions of difficulty, indicating that the overall user interface and navigation are intuitive and user-friendly for most users.

Question 9:

Do you face any difficulty during the payment process in the Hunger Station grocery service?

Analysis:

Most respondents (68.4%) answered “No,” indicating that the payment process is generally smooth and user-friendly. Meanwhile, 14.5% chose “Maybe” and 13.2% said “Never,” suggesting that while most users do not experience issues, a small portion may encounter occasional or unclear difficulties. This points to a mostly positive payment experience, with minor room for improvement in clarity or reliability for some users.

Question 10:

Do you find it difficult to browse products within the Hunger Station grocery service?

Analysis:

A large majority of respondents (67.1%) answered “No,” indicating that browsing products is generally easy and straightforward. Only 9.2% reported difficulty, while 15.8% chose “Maybe” and 7.9% selected “Never.” These results suggest that the browsing experience is largely positive, but there remains a small percentage of users who may face occasional navigation or organization issues, highlighting an opportunity for minor interface improvements.

**Question 11:**

What is your level of confidence during the payment process in the Hunger Station grocery service?

Analysis:

The results show a high level of user confidence in the payment process, with 34.2% indicating they are “Very Confident,” another 34.2% “Confident,” and 30.3% “Somewhat Confident.” Notably, no participants selected “Not Confident.” This suggests that users generally feel secure and trust the platform when completing payments, which is a strong indicator of system reliability and perceived safety.

**Question 12:**

Does the Hunger Station grocery service respond quickly during navigation and task execution?

Analysis:

Most users (75%) reported that the service responds quickly, indicating strong performance in terms of speed and responsiveness. However, 21.1% selected “Maybe,” which may reflect occasional delays or inconsistency in performance. Overall, the data suggests a generally smooth user experience with minor room for optimization to ensure consistently fast responses for all users.

**Question 13:**

How satisfied are you with using the Hunger Station grocery service?

Analysis:

Overall satisfaction is high, with 31.6% of respondents being “Very Satisfied” and 44.7% “Satisfied.” An additional 21.1% reported being “Somewhat Satisfied,” while no one indicated dissatisfaction. These results reflect a generally positive user experience, suggesting that the service meets user expectations, though there is still room to enhance the experience for those who are only moderately satisfied.

Question 14:

Do you find the products within the HungerStation grocery service clear and suitable for you?

Analysis:

A large majority of respondents (77.6%) answered “Yes,” indicating that the products are generally well-presented and appropriate for user needs. However, 22.4% chose “Maybe,” suggesting that while most users are satisfied, a portion may occasionally find issues with clarity, descriptions, or product relevance. This points to a mostly effective product display with minor opportunities for improvement.

Question 15:

What suggestions do you have for improving the app?

Analysis:

Participants provided a variety of suggestions aimed at enhancing the user experience. Common themes included the need for more discounts and better pricing, indicating a desire for increased affordability. Other users recommended improved product categorization, and the addition of features tailored for senior users, which suggests a focus on accessibility and easier navigation. Additionally, the ability to save frequent orders was mentioned, reflecting a demand for convenience and time-saving functionality. These insights offer valuable direction for future

User personas:

User Persona 1

Jana Al-Zahrani

Age	20 years
Gender	Female
Education	Bachelor's
Marital Status	Single
Interests	Cooking, online shopping
Location	Makkah, Saudi Arabia

Background:

Jana is a second-year college student living with her family. Her schedule is packed with lectures and university projects, so she relies on the HungerStation app to save time-especially when she needs to order groceries or snacks while she's busy studying or too tired after a long academic day.

Goals: - Order snacks and grocery items quickly and without unnecessary complications. - Find specific items quickly.	Needs: - A Simple and responsive interfaces. - Clear classification of products.
---	--

Pain points:

- The search feature often produces irrelevant or inaccurate results.
- Product categories are sometimes unclear.

User Persona 2

Jouri Sameer

Age	20 years
Gender	Female
Education	Bachelor's
Marital Status	Single
Interests	Medical Student
Location	Makkah, Saudi Arabia

Background:

I'm Jouri ,a 20 year old second year medical student. I'm single and live with family in Mecca . My days are extremely busy,filled with tasks ranging from practical and theoretical lectures to exams and assignments.At the end of a long day ,After completing my tasks,I enjoy ordering food through the Hungerstation app.

Goals: • Fast delivery • Availability of all the items I need	Needs: • Not everything is clearly displayed on the app • there are no regular discounts • cash payment isn't supported,and discounts don't apply when using that method
---	--

Pain points:

1. Information on the app is unclear.
2. Cash payment is not supported.
3. Discounts don't apply to cash payments.
4. There are no regular discounts.

User Persona 3

Hanan Al-Harbi

Age	30 years
Gender	Female
Education	Master
Marital Status	Married
Interests	Cooking, online shopping
Location	Makkah, Saudi Arabia

Background:
She works as a doctor, loves helping people, participates in charitable events, loves trying new foods and developing herself, that's why she uses HungerStation.

Goals: .Work on many skills .Try new foods	Needs: .She doesn't have enough time to develop her skills further .She cannot go to restaurants due to lack of time
---	---

Pain points:
.Difficult to navigate due to unclear product classification
.You find the app design difficult to use.

Key Findings:

- 1)The speed and offers are provided: Many users indicated that the application is fast connecting and there are many offers
- 2)The most purchased products: Many users indicated that the most products they buy were snacks
- 3)Offers on the products: Many users indicated that the most products that have many offers were most of the products
- 4)Availability of products: Many users have indicated that the Hungerstation application grocery provides them with the products they are looking for
- 5)Improvement suggestions: The most requested suggestions were to add resolves complaints within 24 hours, giving it an advantage in urgent cases more products and provide classifications according to the importance of the product

Legal Comparison Between HungerStation and Jahez:

Legal Comparison Between HungerStation and Another Food Delivery App	HungerStation	Jahez
Terms of Use	Users must be 18+. Misuse (like fake orders or coupon abuse) can result in account suspension. Terms may change anytime.	Similar rules. Misuse, fraud, or violating terms can lead to account deactivation.
Privacy Policy	Collects name, phone number, location, order history, and payment method. Data is used for service only and can be deleted upon request.	Collects similar data and uses analytics tools. Data is securely stored and protected.
Payment Methods	Supports card payment, Apple Pay, and cash on delivery. Some orders may require advance payment.	Offers the same options. More flexible in accepting cash in remote areas.
User Rights	Users can cancel orders before preparation. If there are errors or delays, users may receive a refund or a discount coupon as compensation.	Users can report issues at any time using the app. They are usually given a case number and are compensated with either a coupon or a full/partial refund depending on the issue.
Vendors & Drivers	Restaurants sign contracts. They must deliver quality and speed. Drivers are rated and may get bonuses for good performance.	Similar setup. Low driver ratings may lead to suspension. High-performing drivers receive rewards.
Dispute Resolution	Offers live chat support in the app. Most complaints are resolved within 1–2 days depending on the issue.	Provides a complaint form with tracking number. Support may contact the restaurant or driver directly if needed.

Competitor Insights:

By comparing HungerStation with its competitor Jahez, key differences and insights have been observed:

1)Terms & Conditions:

Both apps offer clear usage policies. While Jahez provides more detailed explanations, HungerStation stands out with simpler and more user-friendly rules

2)Privacy:

Both applications collect and protect user data effectively. Jahez focuses more on analytics tools, while HungerStation prioritizes direct and accessible privacy measures

3)Payment Methods:

Both apps support card payments, Apple Pay, and cash on delivery. HungerStation ensures secure and fast payment options across all regions

4)Complaint Handling:

HungerStation offers fast and direct in-app chat support, allowing users to resolve issues efficiently. Jahez uses a case number system, which may take longer

5)Driver and Vendor Policies:

Both platforms track performance, but HungerStation encourages better service through a reward-based approach rather than strict penalties

6)Issue Resolution Speed:

HungerStation is known for its quick response and often

Phase two

Card Sorting:

1.Objective

The goal of this activity is to make the HungerStation Grocery App easier to use by organizing products based on how users naturally group them. Card sorting helps improve the app's categories and overall navigation.

2.Methodology: Open and Closed Card Sorting

This activity was conducted with 5 participants using both open and closed card sorting methods:

- Open Card Sorting: Participants freely grouped a set of grocery items and labeled each group based on their own understanding.
- Closed Card Sorting: Participants organized the same items under predefined category labels.

3.Product Cards Used in the Exercise

The following product cards were used:

- Onion
- Chicken
- Bread
- Yogurt
- Kiwi
- Toast
- Apple
- Eggs
- Milk
- Pringles
- Bajah Pistachios
- KitKat
- Berry Juice
- Lay's Forno
- Bajah Cashews
- Snickers
- Pepsi
- Twix

4.Predefined Categories (for Closed Sorting)

- Fruits and Vegetables
- Meat and Poultry
- Bakery Products
- Dairy and Eggs
- Drinks
- Snacks
- Nuts and Seeds
- Chocolate

5.Procedure Overview

A total of 5 participants completed both open and closed card sorting sessions:

- In the Open Card Sorting, participants grouped the items and named the categories according to their perception.
- In the Closed Card Sorting, they placed the same items into the predefined categories listed above.

6 .Sample Results

- Yogurt, Eggs, and Milk were grouped under Dairy and Eggs
- Milk was also categorized under Drinks
- Onion, Apple, and Kiwi were classified under Fruits and Vegetables
- Chicken was placed under Meat and Poultry
- Bread and Toast were grouped under Bakery Products
- Berry Juice and Pepsi were categorized under Drinks
- Pringles and Lay's Forno were classified under Snacks
- Bajah Pistachios and Bajah Cashews were grouped under Nuts and Seeds
- KitKat, Snickers, and Twix were placed under Chocolate

7.Conclusion & Recommendations

The activity showed that the app's categories can be improved to better match how users expect to find products.

It is recommended to:

- Fruits and Vegetables: Onion, Kiwi, Apple
- Meat and Poultry: Chicken
- Bakery Products: Bread, Toast
- Dairy and Eggs: Yogurt, Eggs, Milk
- Drinks: Milk, Berry Juice, Pepsi
- Snacks: Pringles, Lay's Forno
- Nuts and Seeds: Bajah Pistachios, Bajah Cashews
- Chocolate: KitKat, Snickers, Twix

Second Card Sorting :

1 .Objective

The purpose of this phase is to enhance the categorization structure of the HungerStation Grocery App by using card sorting. This usability method helps determine how users naturally group grocery products, allowing for a more intuitive and efficient navigation experience within the app.

2 .Methodology: Open and Closed Card Sorting

Two types of card sorting methods were employed to gather insights from users:

-Open Card Sorting: Participants were given a set of product cards and asked to group

them in ways that made sense to them. They were also encouraged to assign appropriate category names to each group.

-Closed Card Sorting: Participants were provided with predefined category names and were asked to sort the same product cards under these fixed categories.

3 .Product Cards Used in the Exercise

The following product items were selected based on survey results reflecting common user preferences:

- Orange Juice
- Cheetos
- Tuna
- Low-fat Laban
- Galaxy Chocolate
- Whole Wheat Bread
- Vegetable Oil
- Mineral Water
- Eggs
- Labneh
- Yogurt
- Digestive Biscuits
- Hot Sauce
- Canned Tomatoes

4 .Predefined Categories (for Closed Sorting)

Participants in the closed sorting activity were given the following categories to classify products:

- Dairy Products
- Snacks
- Beverages
- Canned Goods
- Bakery
- Essentials
- Sweets
- Organic & Healthy

5 .Procedure Overview

Participants were asked to complete both types of card sorting. In the open sorting task, they grouped the product cards freely and named each category based on their understanding. In the closed sorting task, they distributed the same cards under the predefined categories provided in Section 4.

6 .Sample Results (Hypothetical)

-Items like 'Orange Juice' and 'Mineral Water' were consistently grouped under Beverages.

-Snacks such as 'Cheetos', 'Digestive Biscuits', and 'Galaxy Chocolate' were grouped under Snacks.

-Health-conscious participants introduced a new category labeled 'Healthy Choices' for items like 'Low-fat Laban' and 'Whole Wheat Bread.'

-Some users preferred more detailed subcategories such as 'Sugary Snacks' and 'Savory Snacks.'

7 .Conclusion & Recommendations

The card sorting activity revealed valuable insights into user preferences and expectations regarding product categorization. Based on the findings, it is recommended to:

- Revise existing categories in the app to better match user mental models.
- Introduce subcategories for frequently purchased or health-oriented items.

-Use insights from the open sorting task to guide future design updates for the grocery section.

A total of 12 participants were involved in the card sorting activities.

Navigation and Search Improvements:

This user interface is optimized to enhance the grocery shopping experience within a delivery app focused on supermarkets and essential products.

At the top, users can find a smart search bar that allows them to easily search for products or stores using either full or partial keywords. The search functionality supports autocomplete and synonym recognition—helping users find results even with varied search terms.

Beneath the search bar, there are highlighted store promotions with discount labels, making it easy for users to discover deals like “35% off from Othaim” or “40% off from Panda”.

Next, users can browse by store categories, including icons for popular supermarket chains like Othaim, Panda, and others. Each store listing displays key information such as:

Estimated delivery time

Customer rating

Delivery fee

Distance

To improve navigation, the app provides smart filters like:

Best Price – to find cost-effective options

Nearest Store – for faster delivery from nearby locations

Most Ordered – to view popular and frequently purchased items

Each store or product is clearly shown with its name, logo, rating, and a direct access button—making the process of browsing, comparing, and ordering groceries fast and user-friendly.

Wireframing (Low-Fi):

Home screen

We reorganized the products into a grid layout based on user distribution from the card sorting results to make it easier, clearer, and more straightforward for the user.

Products page

On the products page, we ensured that the beverages section contains only drink items, with no unrelated products included.

We also clarified the prices, sizes, and types for example, if the user selects the 2.5 price option, only products with that price will be displayed.

We believe this approach will make the user feel more comfortable and make the experience easier, without the need to click too many buttons.

Product Details

Regarding the product details, we provided a precise description so that users who care about calories and nutritional information can benefit from it.

Phase three

Usability Testing

As part of Phase 3 of our Information Architecture project, we conducted a Usability Testing session on our low-fidelity wireframes for the HungerStation Grocery App.

The goal of this testing was to validate whether users can complete tasks smoothly and intuitively using the current app structure and design.

Testing Method:

- Format: In-person session
- Tool: Figma Prototype (Low-Fi Wireframes)
- Participants: 3 students from Umm Al-Qura University
- Device: Laptop

Tasks Tested:

- 1 .Navigate to the 'Drinks' section and add 'Orange Juice' to the cart.
- 2 .Browse the 'Snacks' section and add two units of 'Kinder Max' to the cart.
- 3 .Remove 'Apple Juice' from the cart.
4. Proceed to the checkout page and confirm the total amount.

Results Summary:

User	Total Tasks	Total Time	Errors	Success Rate (%)	Pain Points
User 1	4	3 mins	0	100%	None
User 2	4	3.5 mins	0	100%	None
User 3	4	4 mins	0	100%	None
User 4	4	3 mins	0	100%	None

Iterate:

Based on the usability test results, no changes were necessary. All tested users were able to complete the tasks successfully with no confusion, delays, or errors.

The app's categories, labels, and navigation were found to be intuitive and user-friendly.

Revised IA:

Due to the 100% success rate and absence of usability issues, no revisions were required to the current information architecture or wireframes.
